

Mountainview Animal Hospital

SPRING NEWSLETTER

YOU ARE INVITED TO OUR OPEN HOUSE

Every wonder what the clinic looks like “at the back”? Well, now’s your chance.

Since our opening in the fall of 2001 we have had an open house every two to three years to show the community what we are all about. COVID put a pause on our plans for a few years but now it’s time to have some fun again. It is Mountainview Animal Hospital’s mini version of the “all about pets show”.

Why should you come to our open house?

- Meet our doctors and staff on a more personal level, and take a tour of the hospital
- Learn more about our various services and equipment.
- Learn more about important topics in pet health care. We have a different topic in every room & we have made it fun!
- The Canadian Animal Blood Bank will showcase how they are involving dogs in their communities to help other dogs.
- There will be face painting, games and a Teddy Bear Clinic. Make sure your kids bring their favorite stuffed toy or doll for a check-up.
- Enjoy food & refreshments, weather permitting we will have a barbeque.

OPEN HOUSE

SUNDAY MAY 5

1PM TO 4 PM

To show our appreciation to our wonderful community, we are having an Open House.

Everyone is welcome to attend:

Adults, Kids, and of course your furry friends

Come have some fun with us!

For the Kids!

Teddy Bear Clinic

It’s time for your friend’s annual physical examination.

Have your kids bring in their favorite stuffed animal for a check-up.

Our trained Teddy Bear Doctors will check Teddy’s vital signs, give vaccines, apply bandages and check overall health.

Stuffies will receive a certificate of good health.

TIME WITH TUX

We it’s official, I’m a pirate, Arrrg!

I had cancer near my left eye and in order to remove all the cancer, the surgeon had to remove my left eye. I thought it might slow me down some, but not at all. I am such a handsome cat that even with only one eye, I can still make all the ladies swoon. I might have a bit of a scar when all the healing is done, but that just adds to my rugged masculine good looks. “Oh Lord it’s hard to be humble, when you’re perfect in every way...”

YOUR PET SHOULD NEVER BE A MEAL FOR PARASITES

We can help with the right prevention plan

TICKS are like little vampires, they bite to feed off the blood of their host. Their bite does not hurt, so the host is unaware that this ugly little creature is using them for dinner. As a result, a tick can remain attached & feeding for several days before it is engorged (full) & falls off into the environment. Look for ticks around the ears, neck, groin & armpits of your pets.

In large enough numbers, the tick can cause anemia. They also transmit a number of very devastating diseases, both to animals & people. In Canada, we are mainly concerned with Lyme Disease, Ehrlichiosis and Anaplasma. We can test for these diseases with the same blood test we use to look for heartworm disease.

The ticks are found in tall grass and the leafy material under trees, just waiting to ambush innocent folks & their pets. Ticks are no longer just a concern in the summer, they are a risk even during those winter warm ups; the tick will be actively seeking hosts as soon as the temperature reaches 0°C.

There are a number of veterinary approved products available to prevent or kill ticks. They can be applied as a topical liquid or given as an oral chew. Warning, some of the medications available to our dogs can be toxic to cats, so it's best to consult your veterinarian.

We would be happy to talk about which product will work best to avoid a tick infestation on your pet.

The **HEARTWORM** is a slender worm growing to almost a foot in length & lives in the blood vessels of the heart and lungs. It causes disease related to heart, lung & liver damage, & eventually causes death. Heartworm is spread from dog to dog by mosquitoes.

Treating heartworm disease is difficult, many harsh & expensive medications, & a lot of veterinary care is required. Beware, the battle to kill Heartworm can be deadly to the host dog as well.

The best way to manage heartworm disease is prevention. Every year we screen dogs for heartworm disease by a simple blood test. This same blood test is also used to screen for tick diseases. Once we know the dog is negative for heartworm disease, we start them on monthly medication throughout the summer from June 1st to November.

For more information on heartworm disease: www.heartwormsociety.org

INTESTINAL PARASITES like Roundworms, Hookworms, Whipworms, Tapeworms, Coccidia & Giardia can all live in your pet's stomach & intestines. They are picked up in your backyard, on walks & some even directly from your pet's mom before & after birth.

Unfortunately our pets cannot complain about the milder tummy upsets they may experience, so you may not be aware of the problem. More serious symptoms are vomiting, diarrhea, anemia, & malnutrition.

While transmission is most common in the summer months, freezing temperatures does not kill these parasitic eggs.

Testing your pet's poop for the microscopic eggs regularly & giving medications to prevent infection is the best way to keep your pets healthy.

For more information on intestinal parasites: Companion Animal Parasite Council

The adult **FLEA** spends its entire life on the pet biting & feeding on their blood. A female flea can lay up to 50 eggs per day. These eggs fall off your pet & hatch; the resultant larva live in your carpet, beds, sofas & chairs.

Biting fleas cause severe itchiness, allergic dermatitis & enough blood loss to make your pet anemic. Fleas can also transmit intestinal tapeworms to your pet. This long worm lives in the stomach and intestines, robbing your pet of important nutrients.

Treating a flea problem involves two stages, eliminating the adult fleas on your pet, as well as the eggs & larva in your home. There are a large variety of products available.

Of course, an ounce of prevention is worth a pound of cure. There are a variety of products available that can prevent a flea infestation before it starts, some of which can be combined with the heartworm, tick & intestinal parasite prevention in cats & dogs.
